AUSTIN, TX, June 28, 2013 – Green Revolution Cooling today announced that it has been selected by the Department of Defense (DoD) to build a pair of containerized submersion cooling data center systems at DoD sites. The second and third deployments of the CarnotJet™ system container, these units will combine the tremendous cooling power of the CarnotJet™ system with the spectacularly low acquisition cost of submersion cooling.

“At around \$2 per Watt including everything except power and IT equipment, Green Revolution Cooling’s containerized systems provide the most cost effective way to build out a data center, period.” said CEO & Founder, Christiaan Best. “We are pleased to be working with the Department of Defense on this project and we are excited for future deployments of our new containerized systems. Green Revolution Cooling will continue to deliver unprecedented levels of value to the data center builder and operator.”

Green Revolution Cooling’s submersion cooling technology is ideally suited for containerized installation due to the simplicity of the system design. Unlike air-cooling solutions that require costly air-flow engineering, the CarnotJet™ system is a simple system of pumps, filters, and heat exchangers that is perfectly at-home in the confines of a lightly modified ISO shipping container. In fact, the only installation requirements for the CarnotJet™ system containers is a level installation surface and access to power.

By combining the power of the CarnotJet™ system with the convenience of a shipping container, Green Revolution Cooling has brought to market a maximally deployable product that will be of interest to any data center builder or operator that needs a rapid, drag-and-drop solution for expanding a data center that provides the most efficient cooling available at a fraction of the cost of best practices air-cooling.

For more information of the CarnotJet containerized submersion cooling system, please contact +1 512-692-8003, or sales@grcooling.com.

ABOUT GREEN REVOLUTION COOLING

Green revolution Cooling is the leading provider of performance fluid submersion cooling systems for OEM servers. The company’s flagship product, the CarnotJet™ system, reduces data center cooling energy consumption by 95% and overall data center power consumption by 45% - 50% with one of the lowest acquisition costs in the industry.
